1. A method for laminating glass sheets by placing a plastic film between the glass sheets, wherein plastic film rolls of varying widths are stored in a refrigerated space above a first conveyor, film is unwound from the selected film roll onto the conveyor and a film is cut to a film sheet of a desired length, the film sheet is carried from the refrigerated space into a laminating space having a temperature which is higher than that of the refrigerated space, the film sheet is received in the laminating space onto a second conveyor upon which the film temperature rises and equalizes and the film shrinks prior to lamination, and the film sheet is transferred from the second conveyor onto a glass to be laminated, the latter being carried by a third conveyor which serves as an actual laminating conveyor.

7. An apparatus for laminating glass sheets by placing a plastic film between the glass sheets, said apparatus including a refrigerated space for the storage of plastic film rolls and a laminating space provided with a laminating conveyor for carrying glass sheets to be laminated as well as with a hoisting device for picking up a glass sheet from the laminating conveyor, wherein above the laminating space is located the refrigerated space, including a

Method and apparatus for laminating glass sheets

The present invention relates to a method and apparatus for laminating glass sheets by placing a plastic films between
5 the glass sheets. The apparatus includes a refrigerated space for the storage of rolls of plastic film and a laminating space provided with a laminating conveyor for carrying glass sheets to be laminated as well as with a hoisting device for picking up a glass sheet from the laminating
10 conveyor

The applications of laminated glasses include various safety glasses (protection of property, bullet proofing), sound-proofing glasses in hotels and airports, ultraviolet radiation controlling glasses, display windows etc.
15

Lamination is usually effected by using a PVB-plastic film, which film rolls must be held in a cold storage at less than 10°C in order to prevent the film layers from sticking to each other.
20

One problem with the prior known laminating methods and equipment is that a film transferred from a cold film roll onto a warmer glass sheet shrinks upon heating, whereby the film edges may even contract inside the glass edge since the contraction between glass sheets does not occur controllably and evenly. Therefore, the film must be provided with a considerable shrinkage allowance. Another problem is that, when changing the glass width, the film-roll unwinding unit must be reloaded with a new film roll which must be brought over from a separate cold storage of film rolls. This
25 inconvenient roll replacement is often neglected if the new glass width is just slightly less than the width of a film roll already in operation. However, this increases the
30 amount of film reject, adding to the price of a final product.
35

A 10x10 grid of dots forming the letters 'S' and 'P'. The 'S' is formed by dots at (row, col) coordinates: (1,1), (1,2), (1,3), (1,4), (1,5), (1,6), (1,7), (1,8), (1,9), (1,10), (2,1), (2,2), (2,3), (2,4), (2,5), (2,6), (2,7), (2,8), (2,9), (2,10), (3,1), (3,2), (3,3), (3,4), (3,5), (3,6), (3,7), (3,8), (3,9), (3,10), (4,1), (4,2), (4,3), (4,4), (4,5), (4,6), (4,7), (4,8), (4,9), (4,10), (5,1), (5,2), (5,3), (5,4), (5,5), (5,6), (5,7), (5,8), (5,9), (5,10), (6,1), (6,2), (6,3), (6,4), (6,5), (6,6), (6,7), (6,8), (6,9), (6,10), (7,1), (7,2), (7,3), (7,4), (7,5), (7,6), (7,7), (7,8), (7,9), (7,10), (8,1), (8,2), (8,3), (8,4), (8,5), (8,6), (8,7), (8,8), (8,9), (8,10), (9,1), (9,2), (9,3), (9,4), (9,5), (9,6), (9,7), (9,8), (9,9), (9,10), (10,1), (10,2), (10,3), (10,4), (10,5), (10,6), (10,7), (10,8), (10,9), (10,10). The 'P' is formed by dots at (row, col) coordinates: (1,1), (1,2), (1,3), (1,4), (1,5), (1,6), (1,7), (1,8), (1,9), (1,10), (2,1), (2,2), (2,3), (2,4), (2,5), (2,6), (2,7), (2,8), (2,9), (2,10), (3,1), (3,2), (3,3), (3,4), (3,5), (3,6), (3,7), (3,8), (3,9), (3,10), (4,1), (4,2), (4,3), (4,4), (4,5), (4,6), (4,7), (4,8), (4,9), (4,10), (5,1), (5,2), (5,3), (5,4), (5,5), (5,6), (5,7), (5,8), (5,9), (5,10), (6,1), (6,2), (6,3), (6,4), (6,5), (6,6), (6,7), (6,8), (6,9), (6,10), (7,1), (7,2), (7,3), (7,4), (7,5), (7,6), (7,7), (7,8), (7,9), (7,10), (8,1), (8,2), (8,3), (8,4), (8,5), (8,6), (8,7), (8,8), (8,9), (8,10), (9,1), (9,2), (9,3), (9,4), (9,5), (9,6), (9,7), (9,8), (9,9), (9,10), (10,1), (10,2), (10,3), (10,4), (10,5), (10,6), (10,7), (10,8), (10,9), (10,10).

12 operate at an equal speed and, thus, the film can be set precisely according to the dimensions of a glass sheet.

5 With the exception of the roll width, said unwinding units 6 are identical and each provided with its own cutter element 19. Thus, each of the units 6 is in turn capable of an independent action and, thus, a film width desired at any given time can be selected merely by starting a proper unwinding unit 6.

10

It is obvious that the structural details of the invention can be varied in many ways within the scope of the annexed claims.
